## Substantial part of the digital content exposed via Web services (WS):

- ~ 16,000 API on Programmableweb
- Several domain-specific catalogues:
  - Various databases, retrieval and analysis services provided by the European Bioinformatics Institute<sup>1</sup> (EBI)
  - Biodiversity Web services of the BiodiversityCatalogue<sup>2</sup>
  - Collection of Web Services offering data and applications in Renewable Energy and Environment<sup>3</sup>
  - Web Services for Image Processing<sup>4</sup>
  - REST API for accessing data of "Mairie de Paris"<sup>5</sup>

---

<sup>3</sup> <http://www.webservice-energy.org/>

<sup>4</sup> <https://www.leadtools.com/sdk/image-processing/web-services>

<sup>5</sup> <https://api.paris.fr/>

## Internet service:

A service  $s$  is syntactically described by its set of inputs,  $in(s)$ , and its set of outputs,  $out(s)$  and has a functionality.

### Examples of image processing services<sup>6</sup>

Service	Inputs	Outputs	Functionality
$s_1$	A coloured image	A gray-scale image	Converts input image to a gray-scale one
$s_2$	An image and a threshold	A transformed image	Applies a binary thresholding method

<sup>6</sup>From Jungmann, A., and Mohr, F. (2015). An approach towards adaptive service composition in markets of composed services. *Journal of Internet Services and Applications*, 6(1), 1.

# Composite service

A composite service represented by a concrete workflow

A composite service represented by a ServiceData graph

## Our vision of a service management framework

  - Checkpointing recovery technique
  - Static Selection of Fault Tolerance Strategies
  - System Architecture
- 5 Conclusion and Research Perspectives

# Service discovery

- 1 Service Request Extraction :  
Extracting elements that can be used as service's I/O

```
prefix db-owl: <http://dbpedia.org/ontology/>
SELECT ?person ?book Outputs
WHERE {
```

```
  ?person rdf:type db-owl:Writer ;
           db-owl:birthPlace dbpedia:Paris. Inputs
  ?book db-owl:author ?person ;
        db-owl:isbn ?isbn .}
```

# Service discovery

- 1 Service Request Extraction :  
Extracting elements that can be used as service's I/O

```
prefix db-owl: <http://dbpedia.org/ontology/>
SELECT ?person ?book Outputs
WHERE {
  ?person rdf:type db-owl:Writer ;
           db-owl:birthPlace dbpedia:Paris. Inputs
  ?book db-owl:author ?person ;
         db-owl:isbn ?isbn .}
```

- 2 Semantics Lookup :  
Finding semantic concepts similar to or associated with the ones extracted at step 1, using SPARQL queries on the ontology or on LOD

```
prefix db-owl: <http://dbpedia.org/ontology/>
SELECT ?person ?book
WHERE {
  ?person rdf:type db-owl:Writer ;
           db-owl:birthPlace dbpedia:Paris.
  ?book db-owl:author ?person ;
         db-owl:isbn ?isbn .}
```

# Service discovery

## ④ Service Query Generation using for example strategy 3:

$$\{s \mid O_Q \cap in(s) \neq \emptyset\}$$

```
SELECT DISTINCT ?service WHERE {
  ?service a service:Service ; service:presents ?profile .
  ?profile profile:hasInput ?input1 .
  ?input1 process:parameterType dbpedia-owl:Book .
}
```

# Service discovery

## 4 Service Query Generation using for example strategy 3:

$$\{s \mid O_Q \cap in(s) \neq \emptyset\}$$

```
SELECT DISTINCT ?service WHERE {
  ?service a service:Service ; service:presents ?profile .
  ?profile profile:hasInput ?input1 .
  ?input1 process:parameterType dbpedia-owl:Book .
}
```

```
<profile:serviceName xml:lang="en"> BookPrice
  </profile:serviceName><profile:textDescription xml:lang="en">
    Uses the ISBN to return the purchase price
    of a given book title.
  </profile:textDescription>
  <profile:hasInput rdf:resource="#_BOOK"/>
  <profile:hasOutput rdf:resource="#_PRICE"/>
```

# Service discovery

## ④ Service Query Generation using for example strategy 3:

$$\{s \mid O_Q \cap in(s) \neq \emptyset\}$$

```
SELECT DISTINCT ?service WHERE {
  ?service a service:Service ; service:presents ?profile .
  ?profile profile:hasInput ?input1 .
  ?input1 process:parameterType dbpedia-owl:Book .
}
```

### Problem:

When no service answers the user query, several services should be composed to provide the needed outputs from the provided inputs

# Transactional and QoS-aware service selection

## Service selection

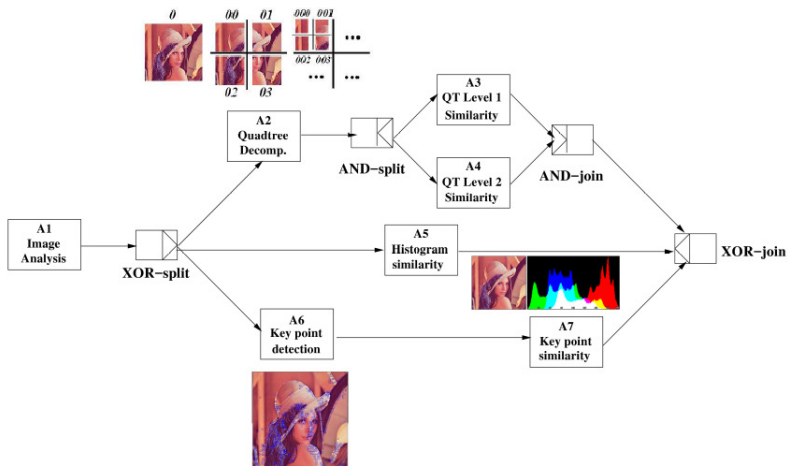

Given a user query  $Q$  that can not be satisfied by a single service: find a composite service that answers the user query

Two kinds of service selection:

- Top-down: Query  $Q$  is a workflow and services are grouped by functionality
- Bottom-up: Query  $Q$  is a set of I/O and services linked by their I/O

- 5 Conclusion and Research Perspectives

# Bottom-up service selection

Given :

- A query  $\mathcal{Q} = (I_{\mathcal{Q}}, O_{\mathcal{Q}})$ , with  $I_{\mathcal{Q}}$  the set of inputs data provided by the user and  $O_{\mathcal{Q}}$  the set of outputs needed by the user, and
- A service registry organised by a ServiceData Graph where services are linked by their I/O based on an ontology

# Bottom-up service selection

Given :

- A query  $Q = (I_Q, O_Q)$ , with  $I_Q$  the set of inputs data provided by the user and  $O_Q$  the set of outputs needed by the user, and
- A service registry organised by a ServiceData Graph where services are linked by their I/O based on an ontology

Can be built from WS-Challenge<sup>7</sup> or from real services<sup>8</sup>

<sup>7</sup>S. Kona et al. WSC-2009: A Quality of Service-Oriented Web Services Challenge. In *IEEE CEC*, 2009

<sup>8</sup>Y.-J. Lee. Algorithm for Automatic Web API Composition. In *WEB*, 2013

## Bottom-up service selection:

## Selecting a sub-graph in the ServiceData Graph

A possible composite service with  $I_Q = \{1, 2\}$  and  $O_Q = \{7, 8\}$

## Bottom-up service selection:

## Selecting a sub-graph in the ServiceData Graph

A possible composite service with  $I_Q = \{1, 2\}$  and  $O_Q = \{7, 8\}$

## QoS-aware service selection

### Selecting component services that optimize the Quality of Service

QoS criteria associated with a service:

- Execution time (criterion to minimize):  
Time needed to execute the service
- Throughput (criterion to maximize):  
Average rate of successful service executions
- Cost (criterion to minimize):  
Fee the user has to pay to invoke the service
- Reliability (criterion to maximize):  
Probability of the service successful executions

## Examples of QoS dataset:

- QoS values extracted from real web services

Name	Response Time (ms)	Throughput (hits/sec)
<a href="#"><u>SiteSearchService</u></a>	100	12.3
<a href="#"><u>GoogleSearchService</u></a>	104.67	8.5
<a href="#"><u>SearchService</u></a>	234.5	13.3
<a href="#"><u>AmazonSearchService</u></a>	85.3	5.1
<a href="#"><u>SearchService</u></a>	343.66	3

QWS Dataset<sup>9</sup>: QoS values extracted from 5,000 web services (Al-Masri et al., 2007)

- Synthetic benchmark: Execution time and throughput introduced in WS-Challenge 2009 (Kona et al. 2009)

## Transactional-aware service selection

Selecting component services to obtain a transactional composite service satisfying the transactional property needed by the user

(a) Pivot service

(b) Compensatable service

(c) Pivot and retrievable service

(d) Compensatable and retrievable service

## Transactional properties for non-composite services<sup>10</sup>

<sup>10</sup> inspired from S. Mehrotra et al. A Transaction Model for Multidatabase Systems. In *ICDC*, 1992

# Links between transactional properties and recovery techniques

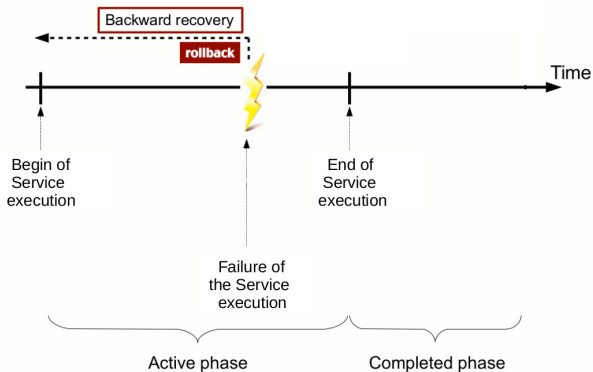

# Links between transactional properties and recovery techniques

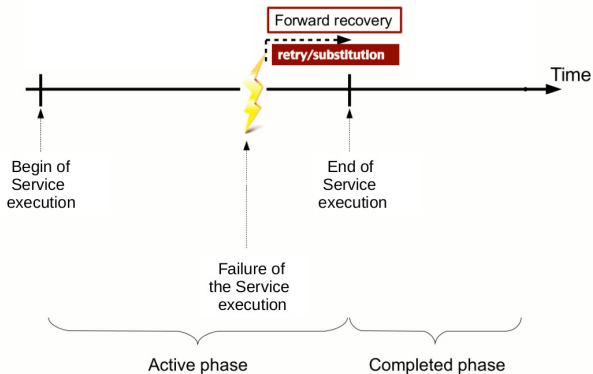

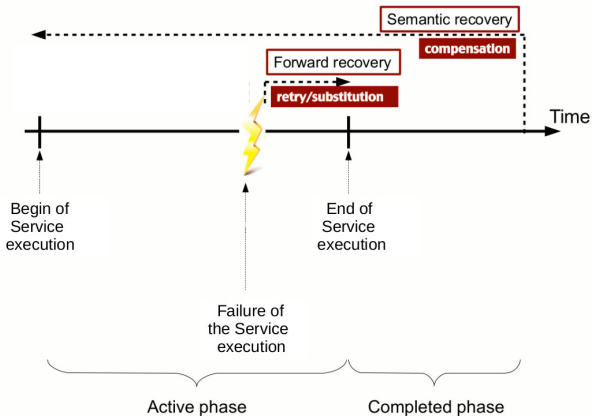

# Links between transactional properties and recovery techniques

# Links between transactional properties and recovery techniques

# Links between transactional properties and recovery techniques

## Transactional properties extended to composite services in [3] (IEEE TSC 2010) :

A composite service is atomic (*a*):

- if once all its component services complete successfully, they cannot be semantically undone
- if one component service does not complete successfully, all previously successful component services have to be compensated

A composite service is compensatable (*c*) if:

all its component services are compensatable

A composite service is retrievable (*r*) if:

all its component services are retrievable

Selecting services by simultaneously considering transactional property support and QoS optimization

Our contributions:

- The first Transactional and *local* QoS-aware service selection approaches for:
  - Top-down selection, presented in ICSW'2008 [12] and IEEE TSC'2010 [3]
  - Bottom-up selection, presented in ICCS'2010 [10], RED'2012 [9] and IJWGS'2011 [2]
- First linear programs modelling Transactional and *global* QoS-aware service selection problem, for:
  - Top-down selection, presented in ISCC'2012 [14] and in DAM'2015 [4]
  - Bottom-up selection, presented in ICSOC'2014 [15]

# Linear program modelling the service selection

For Top-down selection<sup>12</sup>:

- Decision variables for selecting activities and services
- Constraints:
  - induced by the workflow,

- ★  $A_8$  (N° 14) should be executed :  $x_{14} = 1$
- ★ To execute  $A_8$ , AND-JOIN (N° 13) should be executed :  $x_{14} = x_{13}$

<sup>12</sup> supported by the Action de Recherche Fondamentale en Recherche Opérationnelle (ARFRO) of the French Operational Research Group (GDR RO)

# Linear program modelling the service selection

For Top-down selection<sup>12</sup>:

- Decision variables for selecting activities and services
- Constraints:
  - induced by the workflow,

To executed XOR-JOIN (N°12):  
 A<sub>6</sub> or A<sub>7</sub> (N°10 and 11) or  
 AND-JOIN N°9, should be  
 executed :  $x_{12} = x_9 + x_{10} + x_{11}$

<sup>12</sup> supported by the Action de Recherche Fondamentale en Recherche Opérationnelle (ARFRO) of the French Operational Research Group (GDR RO)

# Linear program modelling the service selection

For Top-down selection<sup>12</sup>:

- Decision variables for selecting activities and services
- Constraints:
  - induced by the workflow,
  - modelling the execution time (limited to  $T$ ) and the reliability (guarantee to be  $\geq P$ ) and,
  - induced by transactional properties
- Linear program minimizing the cost, with or without transactional properties
- Experimentations with CPLEX on randomly generated test sets
  - to compare with related works and,
  - to analyse the impact of QoS constraints, number of activities or services on the computational time

---

<sup>12</sup> supported by the Action de Recherche Fondamentale en Recherche Opérationnelle (ARFRO) of the French Operational Research Group (GDR RO)

# Linear program modelling the service selection

For Top-down selection<sup>12</sup>:

- Experimentations with CPLEX on randomly generated test sets, for instances of complex 100-activities workflows

Number of WS per trans. prop.	Average number of variables	Average number of constraints	Average running time (s)
5	2109	16902	2,5
10	4111	24684	3,4
15	6112	17950	3,4
20	8108	20975	4,6
25	10111	16670	5,5
30	12110	19302	6,2
40	16109	13578	5,8
50	20111	19960	10,0

<sup>12</sup> supported by the Action de Recherche Fondamentale en Recherche Opérationnelle (ARFRO) of the French Operational Research Group (GDR RO)

As shown in [4] (Discrete Applied Mathematics 2015)

Top-down service selection problem can be solved:

- In polynomial time when optimizing sum-type QoS criterion (e.g. cost) or a product-type QoS criterion (e.g. reliability)
- In  $O(m)$  for min/max-type QoS criterion (e.g. execution time), with  $m$  the number of leaves in the decomposition tree associated with the serie-parallel graph representing the workflow

# Linear program modelling the service selection

For Bottom-up selection:

- Decision variables for component services, the resulting sub-graph and the topological order
- Constraints:
  - modelling the I/O of services,
  - implied by the user query,
  - induced by transactional properties
- Linear program minimizing the execution time or maximizing the throughput, with or without transactional properties
- Experimentations with CPLEX on randomly generated test sets and on WS-Challenge benchmark
  - to compare with related works, and
  - to analyse the impact induced by transactional properties

# Linear program modelling the service selection

For Bottom-up selection:

- Linear program minimizing a cost or QoS score, with or without transactional properties
- Experimentations with CPLEX on randomly generated test sets and on WS-Challenge benchmark

Experiments of our model on the WS-Challenge 2009 (WSC) test sets

WSC test set	1 (500WS)	2 (4000 WS)	3 (8000 WS)	4 (8000 WS)	5 (15000 WS)
To find optimal sol.	0.35s	3.46s	4.23s	22s	27s
To prove optimality	6.65s	5.8s	6.7s	> 300s	> 300s

- 5 Conclusion and Research Perspectives

## Our system:

- A Coordinator Agent in charge of analysing the composite service to be executed
- A set of self-healing service agents (software components) participating in the same composite service execution:
  - in charge of the execution control of a component service  $s_i$  in a composition
  - having some knowledge about its component service (estimated QoS, transactional property and list of functionally equivalent services)
  - making decisions based on:
    - **what it is expected to happen**,
    - **what really happened** before and during the invocation of its service  $s_i$ , and
    - **what it remains to happen** after the invocation of its service

## Service Agent self-healing performs:

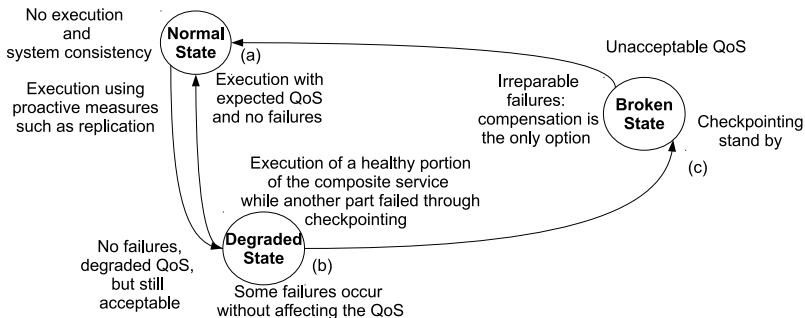

- **detection** based on QoS degradation or service failure;
- **diagnosis** based on CS state, the available recovery mechanism, and user preferences; and
- **recovery** by applying selected actions

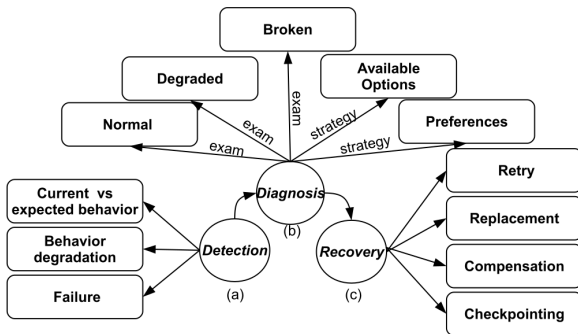

## Service Agent self-healing performs:

- **detection** based on QoS degradation or service failure;
- **diagnosis** based on CS state, the available recovery mechanism, and user preferences; and
- **recovery** by applying selected actions

## Service Agent self-healing performs:

## In IoTBD'2016 [6]:

Application of our approach to Web of Things (WoT), where WoT agents represent physical objects, Web services, or humans in WoT applications

# Outline

- 1 Introduction
- 2 Service discovery
  - Inputs of the discovery
  - Service Request Extraction from SPARQL data query
  - Service Query Generation
- 3 Transactional and QoS-aware service selection
  - Top-down service selection
  - Bottom-up service selection
  - QoS-aware service selection
  - Transactional-aware service selection
  - Transactional and QoS-aware service selection
- 4 Self-healing transactional composite service
  - Checkpointing recovery technique
  - Static Selection of Fault Tolerance Strategies
  - System Architecture
- 5 Conclusion and Research Perspectives

## ① Composite service selection:

- Top-down [3,4,12]:
  - User query expressed by a workflow
  - Selection of a service for each activity of the workflow
  - No I/O link considered between services

## ① Composite service selection:

- Top-down [3,4,12]:
  - User query expressed by a workflow
  - Selection of a service for each activity of the workflow
  - Links between services not considered
- Bottom-up [2,9,10,14,15]:
  - User query expressed by a pair of I/O sets
  - Selection a subgraph in the graph representing services linked by their I/O
  - No expression of the business process wanted by the user

## ① Composite service selection:

- Top-down [3,4,12]:

- User query expressed by a workflow
- Selection of a service for each activity of the workflow
- Links between services not considered

- Bottom-up [2,9,10,14,15]:

- User query expressed by a pair of I/O sets
- Selection a subgraph in the graph representing services linked by their I/O
- No expression of the business process wanted by the user

⇒ Combining both approaches

- ① Composite service selection: combining top-down and bottom-up approaches
- ② Robust dynamic service composition:
  - Two separate steps:
    - Selection process [2,3,49,10,12,14,15]
    - Self-healing execution of the selected composite service [5-8]
  - ⇒ Taking into account QoS degradation or component failures during the selection process

- ① Composite service selection: combining top-down and bottom-up approaches
- ② Robust dynamic service composition: integrating recovery strategies into the selection process
- ③ Transactional properties issue:
  - Definition of a formal model of transactional composite services [3]
  - Extended by several authors [Ding et al., 2015; FanJiang et al., 2014; Rajaram et al., 2014; Wu et al. 2013]

- ① Composite service selection: combining top-down and bottom-up approaches
- ② Robust dynamic service composition: integrating recovery strategies into the selection process
- ③ Transactional properties issue:
  - ? How providing real services with such transactional properties?
  - ? How implementing retrievable property?
  - ? How measuring the atomicity of a composite service based on transactional properties?

- ① Composite service selection: combining top-down and bottom-up approaches
  - ② Robust dynamic service composition: integrating recovery strategies into the selection process
  - ③ Transactional properties issue:
    - ? How providing real services with such transactional properties?
    - ? How implementing retrievable property?
    - ? How measuring the atomicity of a composite service based on transactional properties?
- ⇒ First step to answer such questions in [11]: Measuring Fuzzy Atomicity for Composite Service Execution

- ① Composite service selection: combining top-down and bottom-up approaches
  - ② Robust dynamic service composition: integrating recovery strategies into the selection process
  - ③ Transactional properties issue: Measuring Fuzzy Atomicity for Composite Service Execution
  - ④ A full transactional service management must be able :
    - a) to discover/identify services achieving a specific goal,
    - b) to compose services when no single service reach the needed goal,
    - c) to ensure a reliable composite service execution
- ⇒ Challenges: integrating all approaches and providing/finding a registry of real services

- 1 Composite service selection: combining top-down and bottom-up approaches
- 2 Robust dynamic service composition: integrating recovery strategies into the selection process
- 3 Transactional properties issue: Measuring Fuzzy Atomicity for Composite Service Execution
- 4 Toward a full transactional service management

Thank you! Questions ?
