The Longest Run Subsequence Problem: Further Complexity Results

Riccardo Dondi, **Florian Sikora**

Università degli Studi di Bergamo, Bergamo, Italy,
LAMSADE, Université Paris Dauphine, CNRS – France

Outline

Introduction

FPT Algorithm

Kernelization

Conclusion

Story

- ▶ September 2020, we could attend WABI online
- ▶ We were independently interested by one open problem during a talk [Schrinner et al.] :

Is Longest Run Subsequence FPT w.r.t. the “compressed” size of the solution?

Motivations - reconstruct a genome

- Assembly from a set of reads to contigs
- Need to **order** them (scaffolding)
- Some matches are known (according to similarities)
- Some inconsistencies (errors in sequencing, mutations..)

$$S = y_1 y_1 y_2 y_1 y_4 y_2 y_4 y_3 y_3$$

$$R = y_1 y_1 y_1 y_4 y_4 y_3 y_3$$

Definitions [Schrinner et al.]

- ▶ Given a string S over an alphabet Σ
- ▶ Find the longest subsequence R s.t. each symbol occurs only consecutively (or none)

Definitions [Schrinner et al.]

- ▶ Given a string S over an alphabet Σ
- ▶ Find the longest subsequence R s.t. each symbol occurs only consecutively (or none)

$S = abac aabbab$

$R = aa aabb b$

Definitions [Schrinner et al.]

- ▶ Given a string S over an alphabet Σ
- ▶ Find the longest subsequence R s.t. each symbol occurs only consecutively (or none)

$S = abac\ aabba\ b$

$R = a\ a\ aab\ b\ b$

- ▶ An a -run : substring repeating symbol a
- ▶ Could have no maximal run in the solution
- ▶ Some symbol may not be in the solution

Definitions [Schrinner et al.]

- ▶ Given a string S over an alphabet Σ
- ▶ Find the longest subsequence R s.t. each symbol occurs only consecutively (or none)

$S = abac aabbab$

$R = aa aabb b$

- ▶ An a -run : substring repeating symbol a
- ▶ Could have no maximal run in the solution
- ▶ Some symbol may not be in the solution
- ▶ Interesting parameters:
 - ▶ k : size of the solution
 - ▶ $|\Sigma|$: size of the alphabet
 - ▶ r : number of runs in the optimal solution

Known results [Schrinner et al.]

- ▶ NP-hard
- ▶ FPT w.r.t. $|\Sigma|$ (implemented)
- ▶ ILP

Known results [Schrinner et al.]

- ▶ NP-hard
- ▶ FPT w.r.t. $|\Sigma|$ (implemented)
- ▶ ILP

Open :

- ▶ FPT w.r.t. r ?
- ▶ Approximability ?

Parameterized Complexity

Problem: Vertex Cover

Input: Graph G , integer k

Question: Cover edges with k vertices

Compl.:

Problem: Independent Set

Input: Graph G , integer k

Question: Find k independent vertices

Parameterized Complexity

Problem: Vertex Cover

Input: Graph G , integer k

Question: Cover edges with k vertices

Compl.:

Complexity: NP-complete

Problem: Independent Set

Input: Graph G , integer k

Question: Find k independent vertices

Complexity: NP-complete

Parameterized Complexity

Problem: Vertex Cover

Input: Graph G , integer k

Question: Cover edges with k vertices

Compl.:

Complexity: NP-complete

Brute-force: $O(n^k)$ possibilities

Problem: Independent Set

Input: Graph G , integer k

Question: Find k independent vertices

Complexity: NP-complete

Brute-force: $O(n^k)$ possibilities

Parameterized Complexity

Problem:

Vertex Cover

Input:

Graph G , integer k

Question:

Cover edges with k vertices

Compl.:

Complexity:

NP-complete

Brute-force:

$O(n^k)$ possibilities

Smarter?:

$O(2^k n^2)$ algorithm

Independent Set

Graph G , integer k

Find k independent vertices

NP-complete

$O(n^k)$ possibilities

No $f(k)n^{O(1)}$ algorithm exists

Fixed-Parameter Tractability

- ▶ Problem in FPT: any instance (I, k) solved in $f(k) \cdot |I|^c$.

- ▶ Examples:
 - ▶ Solution of size k in a n -vertices graph.
 - ▶ n voters for k candidates.
 - ▶ Requests of size k in a n -sized database.
 - ▶ ...

Fixed-Parameter Tractability

- ▶ Problem in FPT: any instance (I, k) solved in $f(k) \cdot |I|^c$.

- ▶ Examples:
 - ▶ Solution of size k in a n -vertices graph.
 - ▶ n voters for k candidates.
 - ▶ Requests of size k in a n -sized database.
 - ▶ ...
- ▶ Many way to parameterize.
 - ▶ Solution size.

Fixed-Parameter Tractability

- ▶ Problem in FPT: any instance (I, k) solved in $f(k) \cdot |I|^c$.

- ▶ Examples:
 - ▶ Solution of size k in a n -vertices graph.
 - ▶ n voters for k candidates.
 - ▶ Requests of size k in a n -sized database.
 - ▶ ...
- ▶ Many way to parameterize.
 - ▶ Solution size.
 - ▶ Structure of the input.
 - ▶ ...

How to obtain FPT algorithm?

Illustration D. Marx.

Kernelization

Squirrel from [CFKLMPPS'15]

Parameterized Complexity or LRS

Parameters of decreasing size :

	FPT	Poly Kernel
k	Yes	Yes
$ \Sigma $	Yes [Schrinner et al.]	No
r	Yes & Poly Space	No

$S = abacaabbab$

$|\Sigma| \leq k : R = abc$

$r \leq |\Sigma| : R = aaaabbb$

Outline

Introduction

FPT Algorithm

Kernelization

Conclusion

LRS and polynomials

- ▶ Color-Coding could probably work for parameter r
- ▶ We use a key result of [Koutis and Williams 2008,2009]:

Randomized algorithm to decide in **time** $O^*(2^k)$ and **polynomial space**, if a polynomial represented by an arithmetic circuit contains a **multilinear monomial of degree** k .

Polynomials

- ▶ A monomial is **multilinear** if each variable of the monomial occurs at most once.
- ▶ By definition, the degree of a multilinear monomial is the number of its variables.
- ▶ Example: $P(X) = (x_1^2 x_3 x_5 + x_1 x_2 x_4 x_6)$:
 - ▶ $x_1 x_2 x_4 x_6$ is a multilinear monomial of degree 4.
 - ▶ $x_1^2 x_3 x_5$ is not a multilinear monomial.

Compressed Polynomials

- ▶ An **arithmetic circuit** over a set of variables X is a DAG s.t.:
 - ▶ internal nodes are the operations \times or $+$,
 - ▶ leafs are the elements of X .

Compressed Polynomials

- ▶ An **arithmetic circuit** over a set of variables X is a DAG s.t.:
 - ▶ internal nodes are the operations \times or $+$,
 - ▶ leafs are the elements of X .
- ▶ Example for $P(X) = (x_1 + x_2 + x_3)(x_3 + x_4 + x_5)$.

Polynomials

- ▶ Framework successfully applied for different problems:
 - ▶ k -Path.
 - ▶ k -Tree.
 - ▶ k -Leaf Spanning Tree.
 - ▶ t -Dominating Set.
 - ▶ Graph Motif.
 - ▶ Exemplar Breakpoint Distance.
 - ▶ ...

To solve LRS w.r.t. r

- ▶ A **variable for each symbol** of the alphabet representing a potential run in the solution
- ▶ **Circuit** built via DP more or less representing subsequences
- ▶ A **multilinear** monomial of degree r in the circuit iff there is a solution with r runs

Outline

Introduction

FPT Algorithm

Kernelization

Conclusion

Size of the Kernel

- ▶ In FPT for $k \iff$ there is a kernel for k
- ▶ But $f(k)$ **could be anything** !
- ▶ Better if f is poly

Size of the Kernel

- ▶ In FPT for $k \iff$ there is a kernel for k
- ▶ But $f(k)$ **could be anything** !
- ▶ Better if f is poly

	FPT	Poly Kernel
k	Yes	Yes
$ \Sigma $	Yes [Schrinner et al.]	No
r	Yes & Poly Space	No

Trivial poly-kernel for parameter k

- If there is one **a -run of size at least k** , done

$$k = 3, S = aabca, R = aaa$$

Trivial poly-kernel for parameter k

- ▶ If there is one **a -run of size at least k** , done
- ▶ If **alphabet is larger than k** , done

$$k = 3, S = aabca, R = abc$$

Trivial poly-kernel for parameter k

- ▶ If there is one **a -run of size at least k** , done
- ▶ If **alphabet is larger than k** , done
- ▶ Alphabet is at most k , no a -run is larger than k : **at most k^2 characters**

Hardness

- Informally, one way to prove no poly kernel :

Given t instances of our problem, build a “join” instance I' s.t. I' is true iff at least one of the t instance is true (OR-cross-composition)

[Bodlaender et al.]

Hardness

- ▶ Informally, one way to prove no poly kernel :

Given t instances of our problem, build a “join” instance I' s.t. I' is true iff at least one of the t instance is true (OR-cross-composition)

[Bodlaender et al.]

- ▶ With technical details, we assume that the t instances:
 - ▶ have same size
 - ▶ have same k
 - ▶ are built over the same alphabet

Hardness

Add substrings of $2n$ new symbols around each instance

$$S' = \underbrace{\$ \$ \dots \$}_{2n} \quad S_1 \quad \underbrace{\# \# \dots \# \$ \$ \dots \$}_{2n} \quad S_2 \quad \# \# \dots \# \dots \$ \$ \dots \$ \quad S_k \quad \# \# \dots \#$$

Look for a solution of size $(t + 1) \times 2n + k$

Hardness

Add substrings of $2n$ new symbols around each instance

$$S' = \underbrace{\$ \$ \dots \$}_{2n} \quad S_1 \quad \underbrace{\# \# \dots \# \$ \$ \dots \$}_{2n} \quad S_2 \quad \# \# \dots \# \dots \$ \$ \dots \$ \quad S_t \quad \# \# \dots \#$$

Look for a solution of size $(t+1) \times 2n + k$

If there is a solution of size k in some S_i , take it and add all the $\$$ before and all the $\#$ after

$$S' = \underbrace{\$ \$ \dots \$}_{2n} \quad S_1 \quad \underbrace{\# \# \dots \# \$ \$ \dots \$}_{2n} \quad S_2 \quad \# \# \dots \# \dots \$ \$ \dots \$ \quad S_t \quad \# \# \dots \#$$

Hardness

Add substrings of $2n$ new symbols around each instance

$$S' = \underbrace{\$ \$ \dots \$}_{2n} S_1 \underbrace{\# \# \dots \#}_{2n} \$ \$ \dots \$ S_2 \# \# \dots \# \$ \$ \dots \$ S_t \# \# \dots \#$$

Look for a solution of size $(t+1) \times 2n + k$

If there is a solution of size k in some S_i , take it and add all the $\$$ before and all the $\#$ after

$$S' = \underbrace{\$ \$ \dots \$}_{2n} S_1 \underbrace{\# \# \dots \#}_{2n} \$ \$ \dots \$ S_2 \# \# \dots \# \$ \$ \dots \$ S_t \# \# \dots \#$$

Parameter $|\Sigma|$ is the same plus 2

Kernelization

Conclusion

Complexity

- ▶ Better understanding of the parameterized complexity status of the problem

Complexity

- ▶ Better understanding of the parameterized complexity status of the problem
- ▶ Also, **LRS is APX-hard**, even with at most 2 occurrences for each symbol.
- ▶ (L-)Reduction from Independent Set in cubic graphs

Complexity

- ▶ Better understanding of the parameterized complexity status of the problem
- ▶ Also, **LRS is APX-hard**, even with at most 2 occurrences for each symbol.
- ▶ (L-)Reduction from Independent Set in cubic graphs

“No talk is complete without a picture of reduction that nobody understands” Daniel Marx

$$\begin{aligned}
 S = & w_1 x_{1,2}^1 x_{1,3}^1 x_{1,4}^1 w_1 \#_{1,1} \#_{1,2} \#_{1,3} \\
 & w_2 x_{1,2}^2 x_{2,3}^2 x_{2,4}^2 w_2 \#_{2,1} \#_{2,2} \#_{2,3} \\
 & w_3 x_{1,3}^3 x_{2,3}^3 x_{3,4}^3 w_3 \#_{3,1} \#_{3,2} \#_{3,3} \\
 & w_4 x_{1,4}^4 x_{2,4}^4 x_{3,4}^4 w_4 \#_{4,1} \#_{4,2} \#_{4,3} \\
 & e_{1,2}^1 x_{1,2}^1 e_{1,2}^2 x_{1,2}^2 e_{1,2}^3 x_{1,2}^3 e_{1,2}^4 x_{1,2}^4 e_{1,2}^5 x_{1,2}^5 e_{1,2}^6 x_{1,2}^6 \\
 & e_{1,3}^1 x_{1,3}^1 e_{1,3}^2 x_{1,3}^2 e_{1,3}^3 x_{1,3}^3 e_{1,3}^4 x_{1,3}^4 e_{1,3}^5 x_{1,3}^5 e_{1,3}^6 x_{1,3}^6 \\
 & e_{1,4}^1 x_{1,4}^1 e_{1,4}^2 x_{1,4}^2 e_{1,4}^3 x_{1,4}^3 e_{1,4}^4 x_{1,4}^4 e_{1,4}^5 x_{1,4}^5 e_{1,4}^6 x_{1,4}^6 \\
 & e_{2,3}^1 x_{2,3}^1 e_{2,3}^2 x_{2,3}^2 e_{2,3}^3 x_{2,3}^3 e_{2,3}^4 x_{2,3}^4 e_{2,3}^5 x_{2,3}^5 e_{2,3}^6 x_{2,3}^6 \\
 & e_{2,4}^1 x_{2,4}^1 e_{2,4}^2 x_{2,4}^2 e_{2,4}^3 x_{2,4}^3 e_{2,4}^4 x_{2,4}^4 e_{2,4}^5 x_{2,4}^5 e_{2,4}^6 x_{2,4}^6 \\
 & e_{3,4}^1 x_{3,4}^1 e_{3,4}^2 x_{3,4}^2 e_{3,4}^3 x_{3,4}^3 e_{3,4}^4 x_{3,4}^4 e_{3,4}^5 x_{3,4}^5 e_{3,4}^6 x_{3,4}^6
 \end{aligned}$$

Conclusion

- ▶ Practical issues of the FPT algorithm
- ▶ Close the gap of approximation (trivial $\sqrt{|S|}$ -approx, far from the APX-hardness)

Dziękuję!
